EXPERIMENT 5

NAME:DEVISHREE J ROLLNO:240701702

TASK ANALYSIS AND USER FLOW DESIGN

AIM

To conduct task analysis for an application and design user flows along with wireframes using Lucidchart.

OBJECTIVE

To analyze user tasks in an application and represent them using flow diagrams and wireframes.

TOOL USED

Lucidchart

APPLICATION CHOSEN

Cab Booking Application

TASK ANALYSIS

Task analysis involves identifying the steps a user takes to complete a task in an application.

Main Tasks:

1. User logs into the application
2. User enters pickup and destination
3. User selects ride type
4. User confirms booking
5. User completes payment

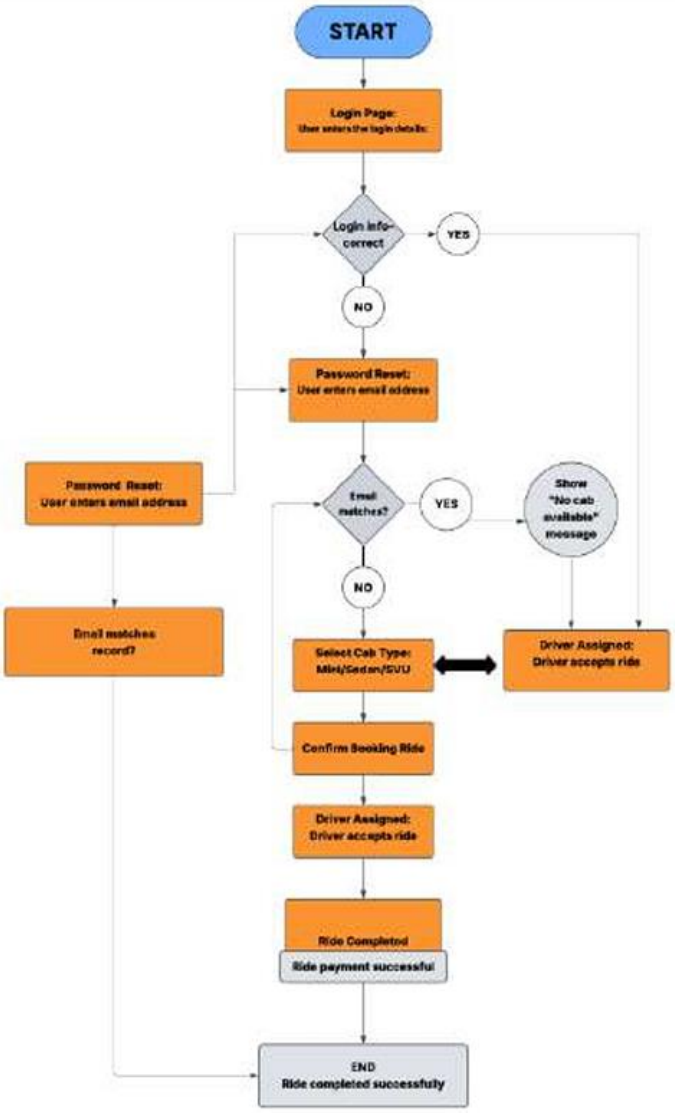
USER FLOW

The user flow describes how a user navigates through the system.

Flow Steps:

START
↓
Login Page
↓
Enter Email & Password
↓
Login Successful?
→ No → Show Error
→ Yes ↓
Enter Pickup & Destination
↓
Find Ride
↓

Choose Ride Type (Mini/Sedan/SUV)
↓
Confirm Ride
↓
Driver Assigned
↓
Payment
↓
END



WIREFRAME DESCRIPTION

Wireframes are basic layouts representing the structure of the application screens.

Screens Designed:

1. Login Screen

- Email/Phone field
- Password field
- Login button

2. Book Ride Screen

- Pickup location field
- Destination field
- Find Ride button

3. Choose Ride Screen

- Ride options (Mini, Sedan, SUV)
- Price display
- Confirm button

4. Ride Completed Screen

- Driver details
- Car details
- Payment button

- 
PROCEDURE

1. Identify the application and user tasks
2. Break down tasks into step-by-step actions
3. Create a user flow diagram in Lucidchart
4. Design wireframes for each screen
5. Connect screens based on user flow
6. Review and finalize the prototype

RESULT

User flow and wireframes for the Cab Booking application were successfully created using Lucidchart.

CONCLUSION

This experiment helped in understanding task analysis, user behavior, and designing structured workflows and wireframes for applications.
